C1100

Round the edges of the negative sheet, so that the metal plates on the mod cannot be tilted and can be easily removed.

26650: Bend the sheet as in the graphic below. You will get better contact with the battery.

18650: In order to make clean contact with the battery, an increase is needed on the copper plate. You can punch this into the material. You have also to shorten the sheet to fit it in the mod.

Assembling 18650 / 26650

Tighten the 510 nut.
Recommended: Screw locking fluid to prevent the nut from getting loose.

Stick magnets into door and body.
Recommended glue:
UHU Max Repair or UHU PLUS ACRYLIT, Tube Binder

Apply shrink tube to the positive copper sheet.
Important to prevent contact between 510 connection and positive coppersheet.

Apply double foam tape. It prevents the sheet from moving.

Screw in the core pin with the positive copper-sheet attached.

Bend the negative sheet like an L. The pressure point on the button is increased which means the mod is more secure in the pocket.

Put in the button.

9

Put in the negative coppersheet.

Before using the Mod please make sure everything is assambled properly and there are no bridges between positive and negative contacts at the 510 connection.
